

Selecting your model Grab Handle

Boat manufacturers provide 30 degree flush mount fishing rod holders in various locations for convenience and space availability.

This illustration shows the typical placement options that are usable for this deck hardware.

Gunwale mount, transom and swim platform installations all provide a possible location for using a Get-a-Grip assist handle.

When selecting a model, the position of the grasping area of the handle should be near or close as possible to the boarding ladder, for safe and easy boarding access.

Before selecting a grab handle you should determine the position of the closest rod holder in relation to the transom boarding area. Measure this distance and chose a grab handle that suits this criteria.
